WP in Docker v1.11 2024-12-17

WP is an open source web content management system

Run WP, MariaDB and phpMyAdmin (optional) as Docker containers using only: **Makefile**, **.env** and **docker-compose.yml**.

Alternative docker-compose examples and other demo files are enclosed.

Extras

- can run cmd_extras.sh after the installation inside the container (adding extra modules?)
- can run install_extras.sh after the installation outside (starting daemons?)
- available **temporary static web** (optional) containers during *suspend*, *backup* and *restore* operations (for users or monitoring services)
- available wp binary with shell completion, bash aliases and some PHP ini setup

Usage

Run make:

- · install install containers
- start start containers
- stop stop containers
- suspend suspend site
- · unsuspend unsuspend site
- test test containers
- fix fix web container permissions
- update update themes and plugins
- kill kill containers
- remove remove containers
- cronrunall run all cron hooks
- · cronrundue run all cron hooks due
- backup backup containers
- restore restore containers
- exec run interactive shell
- exec run='<command>' run <command> in shell
- · debug install and run in the foreground

- lock lock installation for writing
- unlock unlock installation for writing
- config display configuration
- logs display logs
- purge delete persistent data 🛛
- docs transform documentation into PDF

Examples

- make purge install purge everything and fresh install
- make backup test make backup and test
- make purge restore purge everything and restore from backup
- make logs show logs
- make test test containers
